the 1990s, the number of people in the United States who are 65 years of age or older has increased by 50% (U.S. Census Bureau, 2000). The number of people aged 65 and older is projected to increase to 20% of the total population by the year 2020 (U.S. Census Bureau, 2000). The increase in the number of people aged 65 and older is due to a number of factors, including the increase in life expectancy, the increase in the number of people who are married, and the increase in the number of people who are employed. The increase in life expectancy is the most significant factor, as it has led to a significant increase in the number of people who are 65 years of age or older. The increase in the number of people who are married is also a significant factor, as it has led to a significant increase in the number of people who are 65 years of age or older. The increase in the number of people who are employed is also a significant factor, as it has led to a significant increase in the number of people who are 65 years of age or older.
